

SERIES 400 AND AIR SENTRY FILTER REPLACEMENT INSTRUCTIONS

Unplug your air purifier before performing any filter changes.

PREFILTER- Vacuum gently and often. If this filter becomes clogged, it can block air flow to the motor area causing inefficient operation of your unit. This filter will catch large dust, lint, pet hair, etc. It protects the motor compartment and lengthens the life of the HEPA filter. This filter should be changed every 4 months.

HEPA FILTER- Should last one to three years. It is recommended that the HEPA filter be replaced after 2 years of usage. As the HEPA filter loads, it actually becomes more efficient. When you begin to notice a significant drop in air flow, you know it is time to replace the filter. Keep in mind that certain pollutants (like cigarette smoke) can shorten the life of the filter.

MEDIA TRAY- Should last about 6 months. In home situations we estimate that this is the maximum time these trays will last. New trays should be ordered on a regular basis to assure best control of gasses. Try to place your orders well in advance of the time when you will need them.

STANDARD MIX CARBON- will last between 6-9 months, depending on air quality and usage of the purifier. You can check the Purapel by removing 3-4 of the round pellets and crushing it. If there is any purple dust, the carbon still has some life left for absorbing. If the dust is a yellow/tan color, the carbon is used up.

All filters should be changed as needed to main the efficiency of the unit. The above replacement filter life-spans are guidelines. If your filter becomes overly contaminated, you may need to change the filters more frequently.

Place your order well in advance of the time when you will need them. We try to stock all replacement filters but if we are out of stock, a 2-4 week waiting period could result.
